THE PROBLEM

Ambulance drivers can’t get police help in a jam

PERSONA

Ravi, ambulance driver

Hospital ambulance, busy city roads (preliminary persona)

Pain point 1

“The fastest road is jammed, and I only find out once I’m in it.”

Pain point 2

Minutes lost in traffic delay care; calling for help is distracting

What they do today

Maps app + phone calls to police: two channels, no shared status

WHAT OUR MRD TAUGHT US

“Alert police only when the path is jammed AND no other path exists”

Evidence

Maps apps already give ETAs; our value is the alert loop

Assumption

Traffic data and officer availability not yet verified

PRODUCT DECISIONS

What we built, and what we cut

MUST-HAVE · BUILT

- Nearest hospitals with address and contact
- Shortest route + alternatives by distance, ETA
- Auto police alert, acknowledge, driver updates

Success metric: 6/6 rule tests, 0 false alerts, status ≤ 5 s

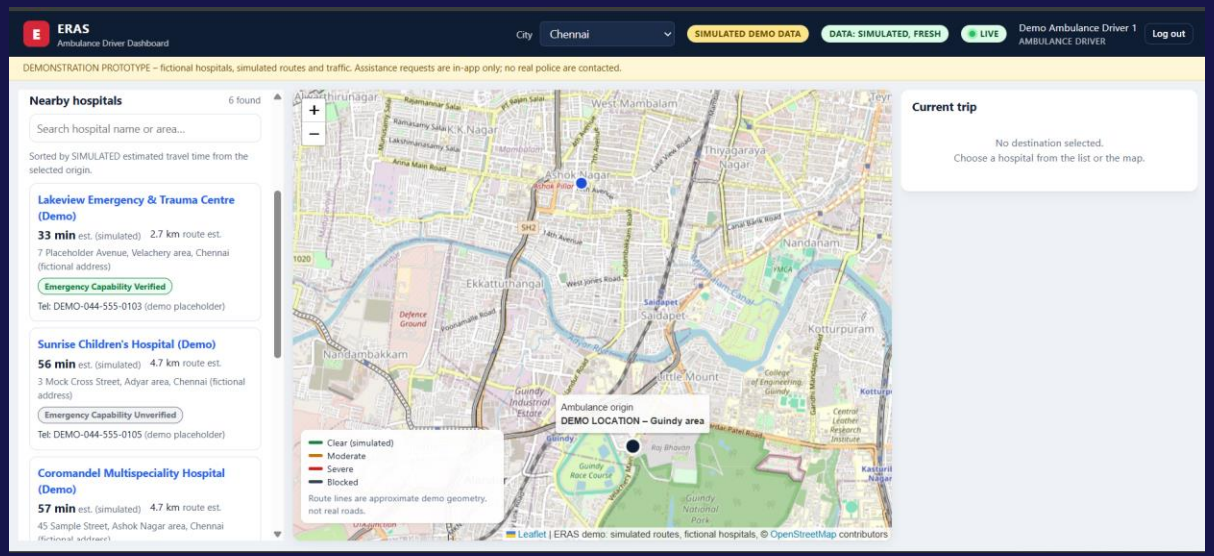

CUT ON PURPOSE

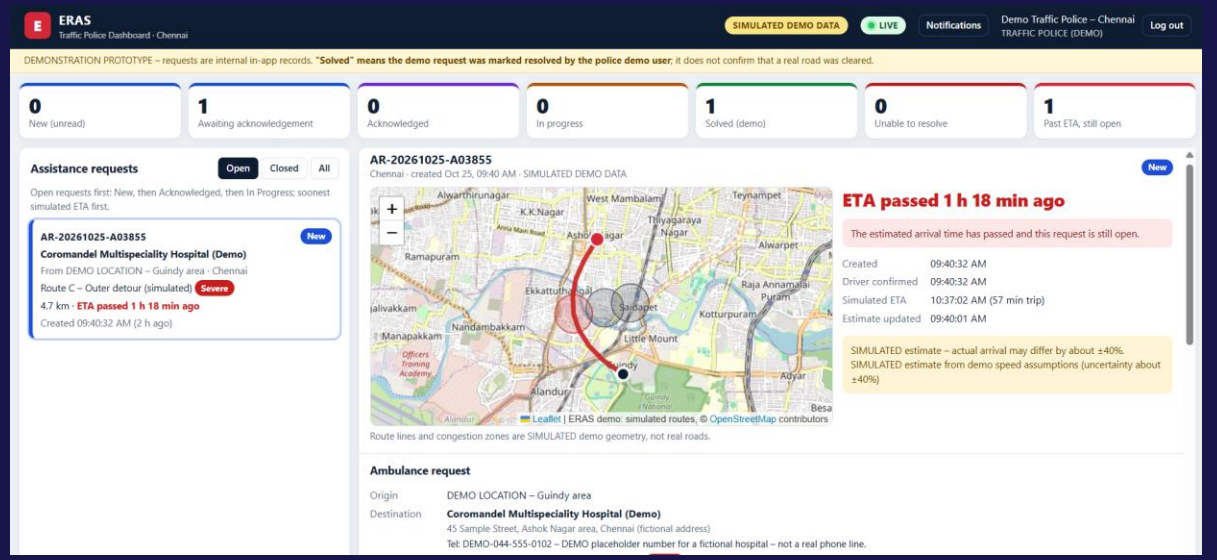

Bed availability — no reliable data source

AI traffic prediction — can't validate in 1.5 days

Police system link — needs official approval

LIVE DEMO – 15 MIN

HOW WE USED AI

What worked, what it got wrong, what we changed

Prompt that worked

“Grade our PRD as a strict examiner”

Tool / skill: Copilot + grill-me

What AI got wrong

Invented a 10-min threshold; kept 7 features as Must-Haves

How we caught it: PRD gate + mentor

What we changed

Thresholds in approved config + 6 tests; cut to 3 Must-Haves
